## **Executive Summary**

Glacial lakes are common in the high elevation of glacierised basin. They are formed when glacial ice or moraines impound water. These lakes normally drain their water through seepage in front of the retreating glacier. Flash floods caused by the outburst of glacial lakes, called as Glacial Lake Outburst Flood (GLOF), are well known in Himalayan terrain, where such lakes are formed due to landslides. Satellite remote sensing based mapping and monitoring of the glacial lakes and water bodies, covering Indian Himalayan region, was taken up. The analysis done for June to October 2020 and Water spread areas for glacial lakes & water bodies compared with inventory year of 2009.

Based on the current inventory, 415 glacial lakes & water bodies with a water spread area more than 50 ha are monitored. Apart from this, another 62 glacial lakes & water bodies with water spread area in the range 44 to 50 ha also have been monitored. Accordingly, a total of 477 glacial lakes & water bodies were considered for monitoring during 2020.

**Satellite images of AWIFS sensor received from NRSC, Hyderabad were used as input for this report.** Water spread areas for glacial lakes & water bodies during June to October 2020 were computed and compared with inventory area of 2009. The data monitored during June to October 2020 is summarised below in tabular form:-

<b>Month</b>	<b>Monitored</b>	<b>Cloud</b>
Jun-2020	218	259
Jul-2020	173	304
Aug-2020	267	210
Sep-2020	222	255
Oct-2020	372	105

# 1. Introduction

## 1.1 Background

Glacial lakes are common in the high elevation of glacierised basin. They are formed when glacial ice or moraines impound water. There are varieties of such lakes, ranging from melt water ponds on the surface of glacier to large lakes in side valleys dammed by a glacier in the main valley. These lakes normally drain their water through seepage in front of the retreating glacier. The moraine creates topographic depression in which the melt water is generally accumulated leading to formation of glacial lake. When this lake is watertight, melt waters will accumulate in the basin until seepage or overflow limits the lake level. Such moraine-dammed lakes appear to be the most common type of glacial lakes. The impoundment of the lake may be unstable, leading to sudden release of large quantities of stored water. Failure of these ice or moraine dams as very destructive events has been documented throughout the world. Flash floods caused by the outburst of glacial lakes, called as Glacial Lake Outburst Flood (GLOF), are well known in Himalaya where such lakes had been formed by landslides.

Satellite remote sensing techniques are used to map, inventory and monitor the glacial lakes & water bodies in Indian Himalayan region, which is formed by joining the catchment of rivers draining in India.

## 1.2 Remote Sensing Technology

Remote sensing is the science of acquiring information about the Earth's surface without actually being in contact with it. This is done by sensing and recording reflected or emitted energy and processing, analyzing, and applying that information. Satellite remote sensing technology contributed significantly to the acquisition of Earth's resources and thus helping for better management of these resources. Satellite remote sensing plays a complementary role to other means of spatial data acquisition i.e., through conventional procedures. Satellite remote sensing offers several unique advantages quick data collection, reliability, more accurate, repetitive collection, geometric integrity and digital storage, which makes it an ideal tool for mapping, inventorying and monitoring the natural resources.

Glaciers and glacial lakes are generally located in remote areas, where access is through tough and difficult terrain. The inventory of glacial lakes using conventional methods requires extensive time and resources together with undergoing hardship in the field. Creating inventories and monitoring of the glacial lakes can be done quickly and correctly using satellite images and aerial photographs. Use of these images and photographs for the evaluation of physical conditions of the area provides greater accuracy. The multi-stage approach using remotely sensed data and field investigation increases the ability and accuracy of the work. Visual and digital image analysis techniques integrated with techniques of geographic information systems (GIS) are very useful for the study of glacier, glacial lakes.

### **1.3 Objectives**

The objectives of the study are based on the inventory of glacial lakes & water bodies in the Indian Himalayan region using satellite data of the year 2009 (Ref: NRSC Report No. NRSC-RS&GISAA-WRG-CWC-Lakes-May2011-TR255), with glacial lakes having spatial extent greater than 50 ha (during the inventorying year) -

1. Monitoring the spatial extent of the glacial lakes & water bodies on monthly basis during June, 2020 to October, 2020
2. Monitoring the spatial extent of 2 selected lakes, if required, with high-resolution data on event basis,

The inventory of glacial lakes & water bodies in the Indian Himalayan region using satellite remote sensing has been carried out using base year of 2009 and monitoring has been done for the years 2011-2020. The changes in the current years will be analysed with respect to the year 2009.

This report presents the details on the data used and methodology followed in monitoring of glacial lakes & water bodies in the Indian Himalayan region using satellite data for the month from June, 2020 to October, 2020.

## 2. Study Area & Materials

### 2.1 Study Area

The present study is carried out for the area covering Indian Himalayas. The study area extends across different countries namely India, Nepal, Bhutan and China. The index map showing study area is given in Figure 1.

### 2.2 Materials

Advanced Wide Field Sensor (AWiFS) data from the Indian remote sensing satellite, Resourcesat-2 has been used in the study for monitoring of glacial lakes pertaining to current month.

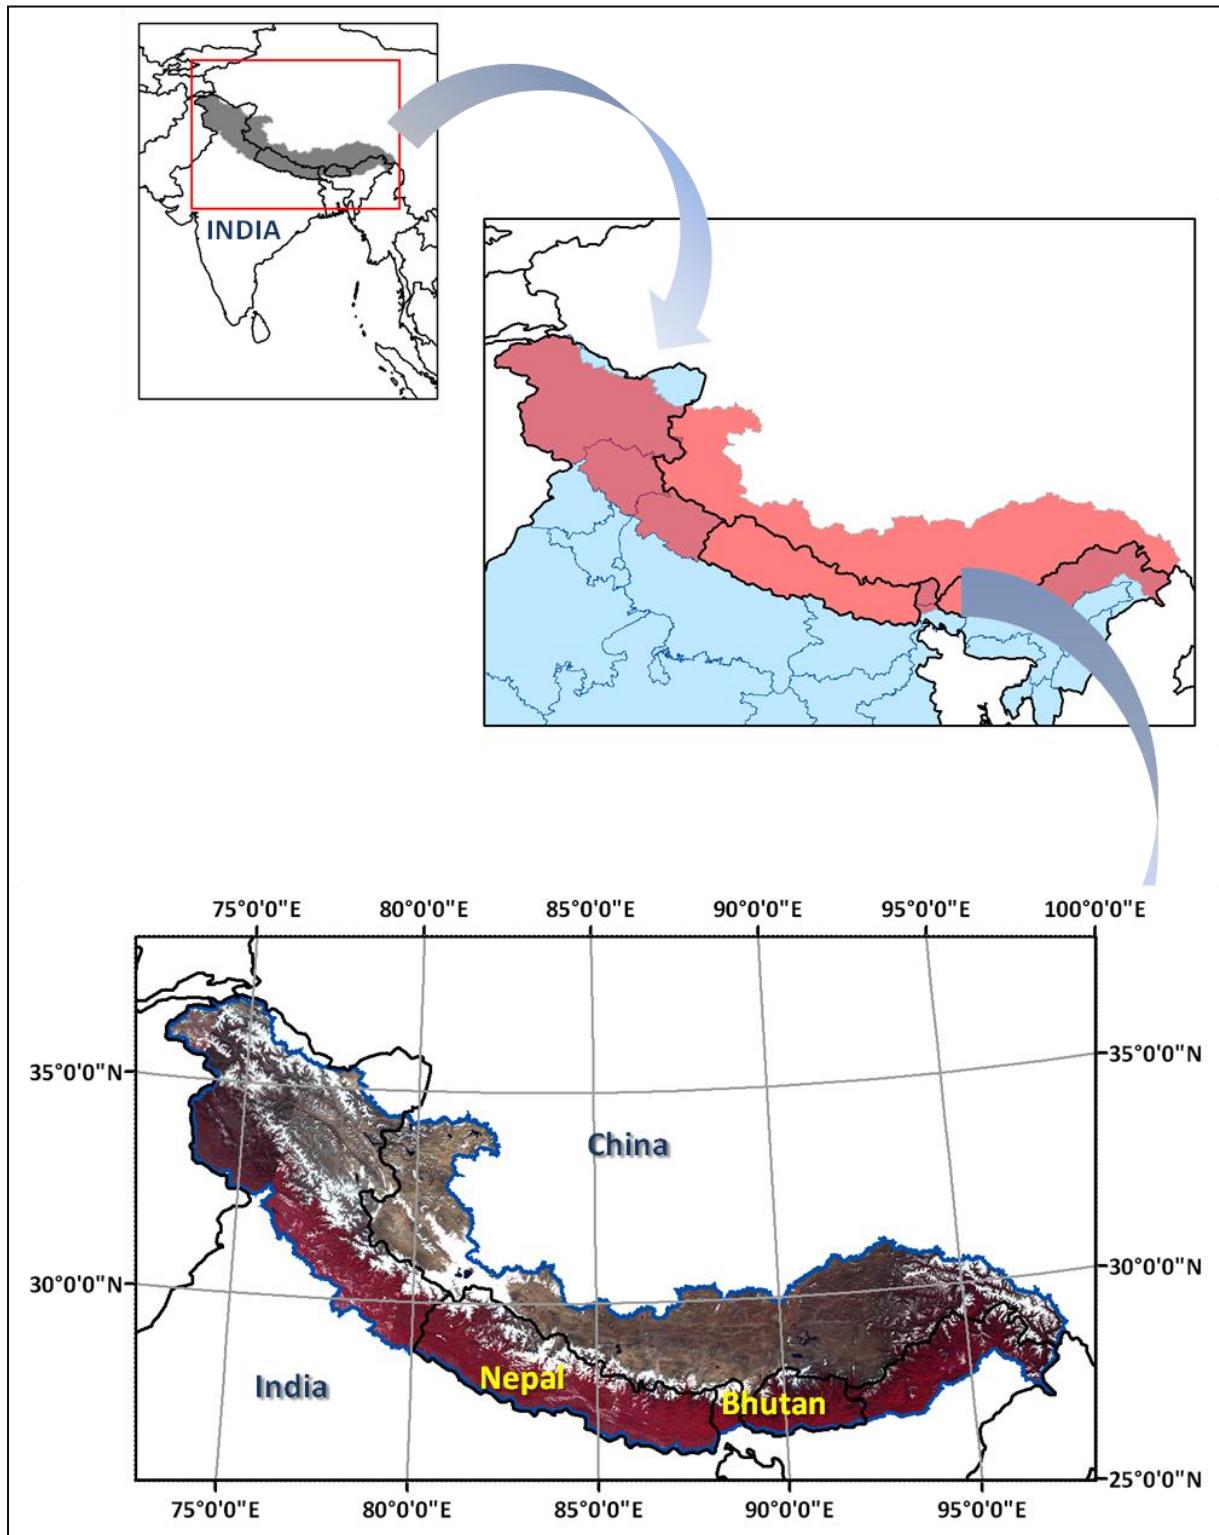

**2.2.1 Satellite Data** - For the purpose of monitoring glacial lakes and water bodies from satellite images, it is preferable to have cloud free satellite images during the time of monitoring. Since the monitoring is carried out during monsoon period, probability of availability of cloud free data is less. Hence all the possible satellite data were browsed and checked for their coverage of the study area and cloud cover.

The list of satellite data used for monitoring during June to October 2020 is given in Table 1.

**Figure 1. Index map of study area**

### **3. Methodology**

The monitoring of glacial lakes and water bodies in the Indian Himalayan region using satellite images involves the following steps.

- Ortho-rectification of satellite data
- Identification & digitization of glacial lakes & water bodies
- Organisation of database

This chapter discusses each of the above steps in detail.

#### **3.1 Orthorectification of Satellite Data**

Orthorectification is the process by which the geometric distortions of the image are modelled and accounted for, resulting in a plan metrically correct image. 3D world is imaged by most sensors in 2D and Orthorectification corrects for many of the anomalies resultant from this conversion. Orthorectified imagery is particularly useful in areas of the world with exacerbated terrain features such as mountains, plateaus, etc. The Orthorectification process yields map-accurate images which can be highly useful as base maps and may be easily incorporated into a GIS. The success of the Orthorectification process depends on the accuracy of the DEM and the correction method.

In this study, Orthorectified data generated under AWIFS derived LU/LC project has been used.

#### **3.2 Monitoring of Glacial Lakes & Water Bodies**

The glacial lakes & water bodies are delineated based on the visual interpretation of satellite images of Resourcesat2 AWIFS sensor. Identification of features was done through panchromatic mode and/or different colour combinations of the multi-spectral bands namely green, red, near infrared and shortwave infrared.

To identify the glacial lakes & water bodies, different image enhancement techniques are used to improve the visual interpretation. This method is complimented with the knowledge and experience of the Himalayan terrain conditions for inventorying glacial lakes and water bodies. With different spectral band combinations in false colour composite (FCC) and in individual spectral bands, glacial lakes and water bodies can be identified. The knowledge of image interpretation keys: colour, tone, texture, pattern, association, shape, shadow, etc. will also enhance the capability of identifying these features.

The water spread area of the lakes in false colour composite images ranges in appearance from light blue to blue to black. The frozen lakes appear white in colour. Sizes of water bodies are generally small, having circular, semi-circular, or irregular shapes with very fine texture. They are generally associated with glaciers in the case of high lying areas, or rivers in the case of low lying areas.

The present study proposed to monitor all the glacial lakes & water bodies that are larger than 50 ha in area. Even though during inventory, glacial lakes and water bodies having area more than 10 ha were digitised, monitoring was carried out only for the glacial lakes & water bodies that are larger than 50 ha. The boundary of glacial lakes and water bodies are digitized as polygon feature using on-screen digitisation techniques. The polygons are geo-processed and the water spread area of glacial lakes & water bodies were computed digitally. These steps were repeated for each date of satellite data and water spread area was computed. The maximum water spread area for each water body among the different dates of satellite in the month of June to October 2020 has been considered for the final analysis of the change in water spread. The following criteria were followed while monitoring the water bodies.

- A change in water spread area within +/- 5% is considered to be no change.
- Partly or fully cloud covered or frozen water bodies have not been considered in monitoring.
- The spatial extent of water spread area during the current month has been mapped and compared with the spatial extent of water spread area mapped during 2009

## 4. Results

### 4.1 Results

#### June 2020

The analysis of water spread area of glacial lakes & water bodies monitored in June 2020 was done for only 218 glacial lakes & water bodies using cloud free satellite data. Based on this, it is found that

- 26 glacial lakes & water bodies have shown decrease in water spread area, 147 have shown increase and 45 have not shown any significant change ( $\pm 5\%$ ).
- 12 out of 26 have decreased by more than 20% and 64 out of 147 water bodies have shown increase in area by more than 20%.

#### July 2020

The analysis of water spread area of glacial lakes & water bodies monitored in July 2020 was done for only 173 glacial lakes & water bodies using cloud free satellite data. Based on this, it is found that

- 28 glacial lakes & water bodies have shown decrease in water spread area, 104 have shown increase and 41 have not shown any significant change ( $\pm 5\%$ ).
- 09 out of 28 have decreased by more than 20% and 33 out of 104 water bodies have shown increase in area by more than 20%.

#### August 2020

The analysis of water spread area of glacial lakes & water bodies monitored in August 2020 was done for only 267 glacial lakes & water bodies using cloud free satellite data. Based on this, it is found that

- 70 glacial lakes & water bodies have shown decrease in water spread area, 118 have shown increase and 79 have not shown any significant change ( $\pm 5\%$ ).
- 27 out of 70 have decreased by more than 20% and 49 out of 118 water bodies have shown increase in area by more than 20%.

#### September 2020

The analysis of water spread area of glacial lakes & water bodies monitored in September 2020 was done for only 222 glacial lakes & water bodies using cloud free satellite data. Based on this, it is found that

- 79 glacial lakes & water bodies have shown decrease in water spread area, 69 have shown increase and 74 have not shown any significant change ( $\pm 5\%$ ).

- 33 out of 79 have decreased by more than 20% and 27 out of 69 water bodies have shown increase in area by more than 20%.

## October 2020

The analysis of water spread area of glacial lakes & water bodies monitored in October 2020 was done for only 372 glacial lakes & water bodies using cloud free satellite data. Based on this, it is found that

- 115 glacial lakes & water bodies have shown decrease in water spread area, 136 have shown increase and 121 have not shown any significant change ( $\pm 5\%$ ).
- 35 out of 115 have decreased by more than 20% and 52 out of 136 water bodies have shown increase in area by more than 20%.

**Table 2 List of glacial lakes & water bodies monitored during the year 2020**

Month	Monitored	Increased			Decreased			No Change
		> 20%	< 20%	Total	> 20%	< 20%	Total

# 5. Conclusions

## 5.1 Conclusions

- i. GL & WB having UID's CH\_6, CH\_33, CH\_36, CH\_38, CH\_39, CH\_55, CH\_59, HP\_3, HP\_5, JK\_85, JK\_159, JK\_187 may affect Jammu & Kashmir including Ladakh, CH\_1, CH\_101, HP\_3, HP\_5, HP\_12 may affect Himachal Pradesh, HP\_12 may affect Punjab, CH\_132, CH\_159, CH\_165, CH\_188, CH\_206, CH\_244, NP\_45, NP\_64 may affect Bihar, SK\_5, SK\_20, SK\_26 may affect Sikkim and West Bengal, CH\_369, CH\_404, CH\_423, CH\_426, CH\_446, CH\_551, CH\_590, CH\_593, CH\_834, CH\_849, CH\_858, CH\_1076, CH\_1079 may affect Arunachal Pradesh & CH\_369, CH\_404, CH\_423, CH\_426, CH\_446, CH\_551, CH\_590, CH\_593, CH\_834, CH\_849, CH\_858, CH\_1076, CH\_1079, SK\_5, SK\_20, SK\_26 may affect Assam respectively as these GLs/WBs have shown increase in water spread area by 40%. These Glacial Lakes/Water Bodies are shown in **Table 3(a)** and **requires vigorous monitoring in order to avoid any future disaster.**
- ii. Water spread area of glacial lakes & water bodies showing Increase in water spread area (>20%) are shown in **Table 3(b).** Last four year trends of this glacial lakes & water bodies have been also shown for comparison. **These Glacial lakes & water bodies requires continuous monitoring in order to avoid any future disaster.**
- iii. Water spread area of glacial lakes & water bodies showing Decrease in water spread area (>20%) are shown in **Table 3(c).** Last four year trends of this glacial lakes & water bodies have been also shown for comparison.

**Table 3 (a): List of GL & WB that have shown INCREASE in water spread area (> 40%)**
